

AMENDMENTS

In the specification, please amend the first full paragraph on page 20 as follows:

Another advanced feature of the present invention is that of the find function illustrated in **FIG. 3AI** and **3AJ**. Assume, for example, a patient is suffering from abdominal pain and after some tests it turns out that the patient has angioedema. By searching through a list of adverse reactions to the medications the patient is currently using, a physician may determine that the patient's condition is caused by other medication he is taking that in a small percentage of the cases causes angioedema. For a physician to know or look up all the possible side effects of every drug is impossible, especially for the less commonly used drugs. Using this function, the physician can search under angioedema and can cross reference the ailment against the medication the patient is taking. Referring to **FIG. 3AI**, a physician may enter the ailment which he has diagnosed. By clicking on the down arrow, the physician is able to select the database in which he would like to search, in this case the adverse reactions database. The physician may then initiate the search by clicking on the "ok" button or cancel the search by clicking on the "cancel" button. Should he click on the "ok" button, the search will start as indicated in **FIG. 3AJ**. A progress [[bas]] bar indicates how much longer the search will take. As evident from **FIG. 3AJ**, at least one drug, namely Floxin, has the adverse reaction of pruritis.
